**NEW QUESTION: 3**Refer to the exhibit. While troubleshooting high CPU utilization on one of your Cisco Catalyst switches, you find that the issue is due to excessive flooding that is caused by STP. What can you do to prevent this issue from happening again?  
**A.** Configure PortFast on interface Gi0/15.  
**B.** Configure UplinkFast on the switch.  
**C.** Change the STP version to RSTP.  
**D.** Disable STP completely on the switch.  
**E.** Configure PortFast on port-channel 1.  
**Answer: A**  
Explanation: Topology Changes (TC) should be a rare event in a well-configured network. When a link on a switch port goes up or down, there is eventually a TC, once the STP state of the port is changing to or from forwarding. When the port is flapping, this would cause repetitive TCs and flooding. Ports with the STP portfast feature enabled will not cause TCs when going to or from the forwarding state. The configuration of portfast on all end-device ports (such as printers, PCs, and servers) should limit TCs to a low amount and is highly recommended.
