Which of the following would BEST handle the rerouting caused by the disruption of service?**A.** Layer 2 switch**B.** Proxy server**C.** Layer 3 switch**D.** Smart hub**Answer: C****Explanation:**The question states that the traffic being transported is a mixture of multicast and unicast signals. There are three basic types of network transmissions: broadcasts, which are packets transmitted to every node on the network; unicasts, which are packets transmitted to just one node; and multicasts, which are packets transmitted to a group of nodes. Multicast is a layer 3 feature of IPv4 & IPv6. Therefore, we would need a layer 3 switch (or a router) to reroute the traffic. Unlike layer 2 switches that can only read the contents of the data-link layer protocol header in the packets they process, layer 3 switches can read the(IP) addresses in the network layer protocol header as well.
