**NEW QUESTION: 1** While monitoring a cluster in the cell, the administrator notices that one server in the cluster periodically loses connections to the database. When this happens, requests to the server have a significantly decreased response time and various error conditions are listed in the log files for the server. Since the error codes are returned quickly, the server starts returning responses faster than the average service times for the application. Due to this, the weight for the server is increased and a large percentage of incoming requests are being routed to the erroneous server and the server is getting overloaded with requests. How can the administrator detect these conditions in the future and take action to prevent this problem? **A.** Configure the storm drain health policy. **B.** Monitor the JVM heap usage to determine a new server weight. **C.** Configure the on demand router (ODR) transport chain to tune inbound connections. **D.** Enable the PMI Extended statistic set and use the Connection Pool summary report. **Answer: A**

**NEW QUESTION: 3** A major manufacturer of popular beverages has appointed a local distributor to serve a specific territory. The demand for the beverages has a pronounced seasonal pattern. The distributor performs well overall, but is repeatedly unable to keep up with fulfilling many customer orders during peak demand periods. The distributor's current delivery capability is stretched to deliver 60 tons of merchandise per day whereas the season's peak demand periods need a daily delivery capability of up to 100 tons. The distributor is under

pressure to fully meet the year-round market demand in order to stay in business. The distributor's management wants to identify and consider more cost-effective options as resorting to adding more trucks and drivers would not be economically feasible. A business analyst (BA) has spent several days observing and measuring the warehouse activities to understand the situation and to gain insights into possible solutions. The delivery workflow is a four-step process: (1) picking the orders and assembling them on trays, (2) bringing the trays to the loading bay, (3) loading the orders into trucks, and (4) delivering the orders to customers. As the following table illustrates, overall performance depends is dependent on five major resources: (1) the workers who pick the orders and load them into trucks, (2) the tallyers who check the orders, (3) the drivers, (4) the trucks, and (5) eight loading bays (LBs). If the driver's average throughput is 0.6 tons/hour, how many hours per day would 15 drivers have to work to deliver 100 tons of merchandise? **A. 0 B. 1 C. 2 D. 3** **Answer: D**
