NEW QUESTION: 1You support Windows 10 Enterprise computers that are members of an Active Directory domain. Recently, several domain user accounts have been configured with super- mandatory user profiles.A user reports that she has lost all of her personal data after a computer restart.You need to configure the user's computer to prevent possible user data loss in the future.What should you do?**A.** Add the .dat extension to the user profile name.**B.** Configure Folder Redirection by using the domain group policy.**C.** Configure the user's documents library to include folders from network shares.**D.** Remove the .man extension from the user profile name.**Answer: B****Explanation:**Folder Redirection allows administrators to redirect the path of a folder to a new location, which can be a folder on the local computer or a directory on a network file share. Users can then work with documents on a server as if the documents were based on a local drive, but are available to the user from any computer on the network. Folder Redirection can be found under Windows Settings in the console tree by editing domain-based Group Policy via the Group Policy Management Console (GPMC).

NEW QUESTION: 3A company plans to use Azure SQL Database to support a mission-critical application.The application must be highly available without performance degradation during maintenance windows.You need to implement the solution.Which three technologies should you implement? Each correct answer presents part of the solution.NOTE: Each correct selection is worth one point.**A.** Always On availability groups**B.** Virtual machine Scale Sets**C.** SQL Data Sync**D.** Premium service tier**E.** Basic service tier**F.** Zone-redundant configuration**Answer: A,D,F****Explanation:**Explanation/Reference:Explanation:A: Premium/business critical service tier

model that is based on a cluster of database engine processes. This architectural model relies on a fact that there is always a quorum of available database engine nodes and has minimal performance impact on your workload even during maintenance activities. E: In the premium model, Azure SQL database integrates compute and storage on the single node. High availability in this architectural model is achieved by replication of compute (SQL Server Database Engine process) and storage (locally attached SSD) deployed in 4-node cluster, using technology similar to SQL Server Always On Availability Groups. F: Zone redundant configuration. By default, the quorum-set replicas for the local storage configurations are created in the same datacenter. With the introduction of Azure Availability Zones, you have the ability to place the different replicas in the quorum-sets to different availability zones in the same region. To eliminate a single point of failure, the control ring is also duplicated across multiple zones as three gateway rings (GW). References:
