NEW QUESTION: 1You have an Azure subscription named Subscription1.Subscription1 contains the virtual machines in the following table:Subscription1 contains a virtual network named VNet1 that has the subnets in the following table.VM3 has multiple network adapters, including a network adapter named NIC3. IP forwarding is enabled on NIC3. Routing is enabled on VM3.You create a route table named RT1 that contains the routes in the following table.You apply RT1 to Subnet1 and Subnet2.For each of the following statements, select Yes if the statement is true. Otherwise, select No.NOTE: Each correct selection is worth one point.

Answer: Explanation:ExplanationIP forwarding enables the virtual machine a network interface is attached to: * Receive network traffic not destined for one of the IP addresses assigned to any of the IP configurations assigned to the network interface. * Send network traffic with a different source IP address than the one assigned to one of a network interface's IP configurations.The setting must be enabled for every network interface that is attached to the virtual machine that receives traffic that the virtual machine needs to forward. A virtual machine can forward traffic whether it has multiple network interfaces or a single network interface attached to it.Box 1: YesThe routing table allows connections from VM3 to VM1 and VM2. And as IP forwarding is enabled on VM3, VM3 can connect to VM1.Box 2: NoVM3, which has IP forwarding, must be turned on, in order for VM2 to connect to VM1.Box 3: YesThe routing table allows connections from VM1 and VM2 to VM3. IP forwarding on VM3 allows VM1 to connect to VM2 via VM3.References:

NEW QUESTION: 2**Answer:** Explanation:ExplanationBox 1: * Token - A user gains access to an RP application by presenting a valid token that was issued by an authority that the RP application trusts. * Identity Provider (IP) - An authority that authenticates user identities and issues security tokens, such as Microsoft account (Windows Live ID), Facebook, Google, Twitter, and Active Directory. When Azure Access Control (ACS) is configured to trust an IP, it accepts and validates the tokens that the IP issues. Because ACS can trust multiple IPs at the same time, when your application trusts ACS, you can your application can offer users the option to be authenticated by any of the IPs that ACS trusts on your behalf.Box 2: WS-Trust is a web service (WS-*) specification and Organization for the Advancement of Structured Information Standards (OASIS) standard that deals with the issuing, renewing, and validating of security tokens, as well as with providing ways to establish, assess the presence of, and broker trust relationships between participants in a secure message exchange. Azure Access Control (ACS) supports WS-Trust 1.3.Incorrect: ACS does not support Kerberos.References:

NEW QUESTION: 3Which three functions are performed by the SQL Tuning Advisor? (Choose

three.)**A.** Recommending optimization of materialized views**B.** Recommending bitmap, function-based, and B-tree indexes**C.** Building the SQL profile**D.** Checking query objects for missing and stale statistics**E.** Recommending restructuring SQL queries that are using bad plans
Answer: C,D,E
Explanation:SQL Tuning Advisor Automatic SQL tuning is exposed through SQL Tuning Advisor.SQL Tuning Advisor runs automatically during system maintenance windows as a maintenance task. During each automatic run, the advisor selects high-load SQL queries in the database and generates recommendations for tuning these queries.SQL Tuning Advisor recommendations fall into the following categories:-Statistics analysis-SQL profiling -Access path analysis-SQL structure analysis A SQL Profile contains additional statistics specific to a SQL statement and enables the optimizer to generate a better execution plan. Essentially, a SQL profile is a method for analyzing a query. Both access path and SQL structure analysis are useful for tuning an application under development or a homegrown production application. A principal benefit of SQL Tuning Advisor is that solutions come from the optimizer rather than external tools (see "Overview of the Optimizer" on page 7-10). Thus, tuning is performed by the database component that is responsible for the execution plans and SQL performance. The tuning process can consider past execution statistics of a SQL statement and customizes the optimizer settings for this statement.

http://www.remote-dba.net/oracle_10g_new_features/tuning_advisor.htmHow the SQL Tuning Advisor Works:The optimizer will work in the new tuning mode wherein it conducts an in-depth analysis to come up with a set of recommendations, the rationale for them and the expected benefit if you follow the recommendations. When working in tuning mode, the optimizer is referred to as the Automatic Tuning Optimizer (ATO).

NEW QUESTION: 4Which string will NOT be translated?**A.** "We'll send you a new password." , "Wir werden dir ein neues Passwort zusenden."**B.** "The coupon has expired" , " Der Coupon ist abgelaufen"**C.** "Click here to continue." , "Klicken Sie hier um weiter zu machen."**D.** "You can save % s %% in the next 15 min." , "Du kannst % s %% in den nächsten 15min sparen"**Answer: C**
