Passing NSE7_EFW-7.2 exam isn't a piece of cake, As long as you study our NSE7_EFW-7.2 training engine and followe it step by step, we believe you will achieve your dream easily.

Our NSE7_EFW-7.2 test questions have been following the pace of digitalization, constantly refurbishing, and adding new things, Our NSE7_EFW-7.2 exam resources are always imitated all the time, but never be surpassed.

As the talent competition increases in the labor market, it has become an accepted fact that the NSE7_EFW-7.2 certification has become an essential part for a lot of people, especial these people who are looking for a good job, because [Fortinet NSE 7 - Enterprise Firewall 7.2](#) the certification can help more and more people receive the renewed attention from the leader of many big companies.

After all, we have set a good example for our high quality.

NEW QUESTION: 1In Microsoft Dynamics CRM 2011, you need to reschedule an existing service activity to a new date and time. What should you do?
A. From the service calendar, copy the service activity to a new service activity.
B. From the service calendar, choose the service activity, and then click Reschedule.
C. Close the existing service activity as Cancelled, and then click Reschedule.
D. Close the existing service activity as No Show, and then create a new service activity.
Answer: B

NEW QUESTION: 2What does the command `diagnose debug fsso-polling refresh-user` do?
A. It refreshes all users learned through agentless polling.
B. It displays status information and some statistics related with the polls done by FortiGate on each DC.
C. It enables agentless polling mode real-time debug.
D. It refreshes user group information from any servers connected to the FortiGate using a collector agent.
Answer: B

NEW QUESTION: 3Unicast Reverse Path Forwarding can perform all of these actions except which one?
A. examine all packets received to make sure that the source addresses and source interfaces appear in the routing table and match the interfaces where the packets were received
B. log its events, if you specify the logging options for the ACL entries used by the unicast rpf command
C. inspect IP packets encapsulated in tunnels, such as GRE
D. combine with a configured ACL
E. check to see if any packet received at a router interface arrives on the best return path
Answer: C
Explanation:For RPF to function, CEF must be enabled on the router. This is because the router uses the Forwarding Information Base (FIB) of CEF to perform the lookup process, which is built from the router's routing table. In other words, RPF does not really look at the router's routing table; instead, it uses the CEF FIB to determine spoofing. Also, RPF cannot detect all spoofed packets. For the network in this example, the perimeter router cannot determine spoofing from packets received on the external E1 interface if they match the default route statement. Therefore, the more routes your router has in its CEF FIB table, the more likely the router will be capable of detecting spoofing attacks. In addition, RPF cannot detect any spoofed packets that are encapsulated, such as packets encapsulated in GRE, IPSec,

L2TP, and other packets. Network administrators can use Unicast Reverse Path Forwarding (Unicast RPF) to help limit the malicious traffic on an enterprise network. This security feature works by enabling a router to verify the reachability of the source address in packets being forwarded. This capability can limit the appearance of spoofed addresses on a network. If the source IP address is not valid, the packet is discarded. Unicast RPF works in one of three different modes: strict mode, loose mode, or VRF mode. Note that not all network devices support all three modes of operation. Unicast RPF in VRF mode will not be covered in this document. When administrators use Unicast RPF in strict mode, the packet must be received on the interface that the router would use to forward the return packet. Unicast RPF configured in strict mode may drop legitimate traffic that is received on an interface that was not the router's choice for sending return traffic. Dropping this legitimate traffic could occur when asymmetric routing paths are present in the network. When administrators use Unicast RPF in loose mode, the source address must appear in the routing table. Administrators can change this behavior using the allow-default option, which allows the use of the default route in the source verification process. Additionally, a packet that contains a source address for which the return route points to the Null 0 interface will be dropped. An access list may also be specified that permits or denies certain source addresses in Unicast RPF loose mode. Care must be taken to ensure that the appropriate Unicast RPF mode (loose or strict) is configured during the deployment of this feature because it can drop legitimate traffic. Although asymmetric traffic flows may be of concern when deploying this feature, Unicast RPF loose mode is a scalable option for networks that contain asymmetric routing paths. Unicast RPF in an Enterprise Network In many enterprise environments, it is necessary to use a combination of strict mode and loose mode Unicast RPF. The choice of the Unicast RPF mode that will be used will depend on the design of the network segment connected to the interface on which Unicast RPF is deployed. Administrators should use Unicast RPF in strict mode on network interfaces for which all packets received on an interface are guaranteed to originate from the subnet assigned to the interface. A subnet composed of end stations or network resources fulfills this requirement. Such a design would be in place for an access layer network or a branch office where there is only one path into and out of the branch network. No other traffic originating from the subnet is allowed and no other routes are available past the subnet. Unicast RPF loose mode can be used on an uplink network interface that has a default route associated with it. Reference <http://www.cisco.com/web/about/security/intelligence/unicast-rpf.html>
