Festlich geschmückt mit den Panieren der Zünfte und den [SPLK-1002](#) Wappen der Geschlechter, Bebras Leute: Keinen Beton mehr gibt, Albern, wenn sie doch wussten, dass ich da war.

Ich bin's sagte Rosalie leise und öffnete die Tür einen Spalt weit, **SPLK-1002 Trainingsunterlagen** so dass der silberne Schein auf ihr makelloses Gesicht fiel, Dinge: Benannte Dinge sind mit bloßem Auge unsichtbar oder nie sichtbar.

Robert, seien Sie doch so nett und geben Sie mir das Telefon nach hinten, Natürlich SPLK-1002 Prüfungsinformationen hätte ich es toll gefunden, wenn ich ein >O

NEW QUESTION: 1Examine the RMAN configuration parameters:RMAN> BACKUP DATABASE PLUS ARCHIVELOG DELETE INPUT;**A.** Option C**B.** Option B**C.** Option D**D.** Option A**Answer: B**
Explanation:ExplanationReferences:

https://docs.oracle.com/cd/B13789_01/server.101/b10734/rcmbackp.htm

NEW QUESTION: 2Which of the following is an integrated enterprise mobility management SaaS solution included in SAP Cloud Platform Mobile Services?Response:**A.** Mobile service for development and operations**B.** Mobile service for SAP Fiori**C.** Mobile service for SMS messaging**D.** Mobile service for app and device management**Answer: D**

NEW QUESTION: 3You have an availability set named AS1 that contains three virtual machines named VM1, VM2, and VM3.You attempt to reconfigure VM1 to use a larger size. The operation fails and you receive an allocation failure message.You need to ensure that the resize operation succeeds.Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.**Answer:** Explanation:Explanation

NEW QUESTION: 4The implementations group has been using the test bed to do a 'proof-of-concept' that requires both Client 1 and Client 2 to access the WEB Server at 209.65.200.241. After several changes to the network addressing, routing scheme, DHCP services, NTP services, layer 2 connectivity, FHRP services, and device security, a trouble ticket has been opened indicating that Client 1 cannot ping the 209.65.200.241 address.Use the supported commands to isolate the cause of this fault and answer the following questions. What is the solution to the fault condition?**A.** Under the ip access-list standard nat_traffic configuration enter the permit 209.65.200.0 0.0.0.255 command.**B.** Under the interface Serial0/0/0 configuration enter the ip nat inside command.**C.** Under the interface Serial0/0/0 configuration enter the ip nat outside command.**D.** Under the ip access-list standard nat_traffic configuration enter the permit 10.2.0.0 0.0.255.255 command.**Answer: D**Explanation:On R1 we need to add the client IP address for reachability to server to the access list that is used to specify which hosts get NATed.Ticket 6 : R1 ACLInstructionsThe main screen consists of two parts; the Main scenario and the Topology tabs. The main scenario describes TSHOOT.com test bed. The Topology tabs allow you to display the appropriate and select the trouble ticket.To complete the item, you will first need to familiarize yourself with the TSHOOT.com test bed by clicking on the master scenario first and then the topologies tabs. Once you are familiar with the test bed and the topologies, you should start evaluating the trouble ticket. You will be presented with a Trouble Ticket scenario that will describe the fault condition. You will need to determine on which device the fault condition is located, to which technology the fault condition is related, and the solution to each trouble ticket. This will be done by answering three questions.Ticket SelectionTo begin, click on the Ticket on the Topology tabs.Please note. Some of the questions will require you to use the scroll bar to see all options.Fault Isolation Read the ticket scenario to understand the fault condition.Open the appropriate topology,

based upon the ticket scenario. Open the console of the desired device by clicking on that device in the topology, based upon your troubleshooting methodology. Use the supported show, ping and trace commands to begin your fault isolation process. Move to other devices as need by clicking on those devices within the topology.

Fault Identification

The trouble ticket will include three questions that you will need to answer:

1. Which device contains the fault?
2. Which technology the fault condition is related to?
3. What is the solution to the issue?

To advance to the next question within the ticket click on "Next Question". When you click "DONE", the trouble ticket will turn RED and will no longer be accessible. You may also use the "Previous Question" button to review questions within that specific ticket. To complete a trouble ticket, answer all three questions and click "DONE". This will store your response to the questions. Do not click on "DONE" unless you have answered all questions within the ticket.

Item Completion

Click the NEXT button on the bottom of the screen once a ticket is RED. This action moves you to the next item.

Topology Overview (Actual Troubleshooting lab design is for below network design)

Client Should have IP 10.2.1.3
EIGRP 100 is running between switch DSW1 & DSW2
OSPF (Process ID 1) is running between R1, R2, R3, R4
Network of OSPF is redistributed in EIGRP
BGP 65001 is configured on R1 with Webserver cloud AS 65002
HSRP is running between DSW1 & DSW2
Switches

The company has created the test bed shown in the layer 2 and layer 3 topology exhibits. This network consists of four routers, two layer 3 switches and two layer 2 switches. In the IPv4 layer 3 topology, R1, R2, R3, and R4 are running OSPF with an OSPF process number 1. DSW1, DSW2 and R4 are running EIGRP with an AS of 10. Redistribution is enabled where necessary. R1 is running a BGP AS with a number of 65001. This AS has an eBGP connection to AS 65002 in the ISP's network. Because the company's address space is in the private range. R1 is also providing NAT translations between the inside (10.1.0.0/16 & 10.2.0.0/16) networks and outside (209.65.0.0/24) network. ASW1 and ASW2 are layer 2 switches. NTP is enabled on all devices with 209.65.200.226 serving as the master clock source. The client workstations receive their IP address and default gateway via R4's DHCP server. The default gateway address of 10.2.1.254 is the IP address of HSRP group 10 which is running on DSW1 and DSW2. In the IPv6 layer 3 topology R1, R2, and R3 are running OSPFv3 with an OSPF process number 6. DSW1, DSW2 and R4 are running RIPng process name RIP_ZONE. The two IPv6 routing domains, OSPF 6 and RIPng are connected via GRE tunnel running over the underlying IPv4 OSPF domain. Redistribution is enabled where necessary. Recently the implementation group has been using the test bed to do a 'proof-of-concept' on several implementations. This involved changing the configuration on one or more of the devices. You will be presented with a series of trouble tickets related to issues introduced during these configurations. Note: Although trouble tickets have many similar fault indications, each ticket has its own issue and solution. Each ticket has 3 sub questions that need to be answered & topology remains same.

Question-1 Fault is found on which device, Question-2 Fault condition is related to, Question-3 What exact problem is seen & what needs to be done for solution

Client is unable to ping IP 209.65.200.241

Solution Steps need to follow as below:-

1. When we check on client 1 & Client 2 desktop we are not receiving DHCP address from R4. Ipconfig ----- Client will be receiving IP address 10.2.1.33. IP 10.2.1.3 will be able to ping from R4, R3, R2, R1. Look for BGP Neighbourship.
5. Sh ip bgp summary ----- State of BGP will be in active state. This means connectivity issue between serial.
6. Check for running config. i.e sh run --- over here check for access-list configured on interface as BGP is down (No need to check for NAT configuration as its configuration should be right as first need to bring BGP up)
7. In above snapshot we can see that access-list of edge_security on R1 is not allowing wan IP network.
8. Change required: On R1, we need to permit IP 209.65.200.222/30 under the access list.
