Demotesten** Schlachtreihen, nur ein wildes Durcheinander von Bannern und Klingens, go past
or by, pass vorwärts ahead, forward W wach, awake wachen, intr.

NEW QUESTION: 1BackgroundCorporate InformationFabrikam, Inc. is a retailer that sells
electronics products on the Internet. The company has a headquarters site and one satellite
sales office. You have been hired as the database administrator, and the company wants you to
change the architecture of the Fabrikam ecommerce site to optimize performance and reduce
downtime while keeping capital expenditures to a minimum. To help with the solution,
Fabrikam has decided to use cloud resources as well as on-premise servers.Physical Locations
All of the corporate executives, product managers, and support staff are stationed at the
headquarters office. Half of the sales force works at this location. There is also a satellite sales
office. The other half of the sales force works at the satellite office in order to have sales people
closer to clients in that area. Only sales people work at the satellite location.Problem
StatementTo be successful, Fabrikam needs a website that is fast and has a high degree of
system uptime. The current system operates on a single server and the company is not happy
with the single point of failure this presents. The current nightly backups have been failing due
to insufficient space on the available drives and manual drive cleanup often needing to happen
to get past the errors. Additional space will not be made available for backups on the HQ or
satellite servers. During your investigation, you discover that the sales force reports are causing
significant contention.ConfigurationWindows LoginsThe network administrators have set up
Windows groups to make it easier to manage security. Users may belong to more than one
group depending on their role. The groups have been set up as shown in the following table:
Server Configuration The IT department has configured two physical servers with Microsoft
Windows Server 2012 R2 and SQL Server 2014 Enterprise Edition and one Windows Azure
Server. There are two tiers of storage available for use by database files only a fast tier and a
slower tier. Currently the data and log files are stored on the fast tier of storage only. If a
possible use case exists, management would like to utilize the slower tier storage for data files.
The servers are configured as shown in the following table:DatabaseCurrently all information is
stored in a single database called ProdDB, created with the following script:The Product table
is in the Production schema owned by the ProductionStaff Windows group. It is the main table
in the system so access to information in the Product table should be as fast as possible. The
columns in the Product table are defined as shown in the following table:The SalesOrderDetail
table holds the details about each sale. It is in the Sales schema owned by the SalesStaff
Windows group. This table is constantly being updated, inserted into, and read. The columns in
the SalesOrderDetail table are defined as shown in the following table:Database IssuesThe
current database does not perform well. Additionally, a recent disk problem caused the system
to go down, resulting in lost sales revenue. In reviewing the current system, you found that
there are no automated maintenance procedures. The database is severely fragmented, and
everyone has read and write access.RequirementsDatabaseThe database should be configured
to maximize uptime and to ensure that very little data is lost in the event of a server failure. To
help with performance, the database needs to be modified so that it can support in-memory
data, specifically for the Product table, which the CIO has indicated should be a
memoryoptimized table. The auto-update statistics option is set off on this database. Only
product managers are allowed to add products or to make changes to the name, description,
price, cost, and supplier. The changes are made in an internal database and pushed to the
Product table in ProdDB during system maintenance time. Product managers and others
working at the headquarters location also should be able to generate reports that include

supplier and cost information. Customer data access Customers access the company's website to order products, so they must be able to read product information such as name, description, and price from the Product table. When customers place orders, stored procedures called by the website update product quantity on-hand values. This means the product table is constantly updated at random times. Customer support data access Customer support representatives need to be able to view and not update or change product information. Management does not want the customer support representatives to be able to see the product cost or any supplier information. Sales force data access Sales people at both the headquarters office and the satellite office must generate reports that read from the Product and SalesOrderDetail tables. No updates or inserts are ever made by sales people. These reports are run at random times and there can be no reporting downtime to refresh the data set except during the monthly maintenance window. The reports that run from the satellite office are process intensive queries with large data sets. Regardless of which office runs a sales force report, the SalesOrderDetail table should only return valid, committed order data; any orders not yet committed should be ignored. Historical Data The system should keep historical information about customers who access the site so that sales people can see how frequently customers log in and how long they stay on the site. The information should be stored in a table called Customer Access. Supporting this requirement should have minimal impact on production website performance. Backups The recovery strategy for Fabrikam needs to include the ability to do point in time restores and minimize the risk of data loss by performing transaction log backups every 15 minutes. Database Maintenance The company has defined a maintenance window every month when the server can be unavailable. Any maintenance functions that require exclusive access should be accomplished during that window. Project milestones completed Revoked all existing read and write access to the database, leaving the schema ownership in place. Configured an Azure storage container secured with the storage account name MyStorageAccount with the primary access key StorageAccountKey on the cloud file server. SQL Server 2014 has been configured on the satellite server and is ready for use. On each database server, the fast storage has been assigned to drive letter F:, and the slow storage has been assigned to drive letter D:. You need to recommend a solution to back up DB1. What should you include in the recommendation? **A. Azure Blob storage B. Azure Document DB C. Azure Queue storage D. Azure Table Storage** **Answer: A** Explanation: Explanation/Reference: Explanation: For SQL Server the Azure Blob Storage service offers a better alternative to the often used tape option to archive backups. Tape storage might require physical transportation to an off-site facility and measures to protect the media. Storing your backups in Azure Blob Storage provides an instant, highly available, and a durable archiving option. NEW QUESTION: 2 A. Option B B. Option A C. Option D D. Option C **Answer: C**

NEW QUESTION: 3

シンクライアントデバイスを使用してXenAppホストデスクトップにアクセスするユーザーは、セッションプリンターポリシーを使用して管理者がプロビジョニングした新しいネットワークプリンターを見ることができますが、このプリンターに印刷することはできません。

管理者はこれを解決するために何ができますか？ **A.**

すべてのクライアントプリンターの自動作成ポリシーを有効にします。 **B.**

XenAppサーバーとプリントサーバーに正しいプリンタードライバーをインストールします。 **C.**

新しいプリンターをセッションプリンターポリシーに追加します。 **D.**

新しいプリンターがデフォルトのプリンターポリシーに追加されたことを確認します。 **Answer: B**
