NEW QUESTION: 1 You need to configure a new Fibre Channel port channel from the Cisco UCS Manager GUI. To do this, from the SAN tab, you navigate to SAN Cloud > Fabric A or B > FC Port Channels, and you click the plus sign. In the popup window, you specify the Fibre Channel port channel name and ID. Which two rules should you follow when you set the Fibre Channel port channel name and ID? (Choose two.)
A. The Name field is optional, but it cannot contain spaces.
B. The Name field must be a number.
C. The Fibre Channel port channel ID must be a number.
D. The ID field can contain ASCII characters, except for spaces.
E. The Fibre Channel port channel ID is optional.
Answer: A,C
Explanation: Explanation Explanation Explanation/Reference: The identifier for the port channel. Enter an integer between 1 and 256. This ID cannot be changed after the port channel has been saved. Name field A user-defined name for the port channel. This name can be between 1 and 16 alphanumeric characters. You cannot use spaces or any special characters other than - (hyphen), _ (underscore), : (colon), and . (period), and you cannot change this name after the object has been saved. The Fibre Channel port channel ID is NOT optional The ID field CANNOT contain ASCII characters, OR spaces. The Name field must be a number IS NOT CORRECT. The Fibre Channel port channel ID must be a number. IS CORRECT The Name field is optional, but it cannot contain spaces. IS CORRECT The name field is optional (notice the "Next >" button is available when the name field is empty).

NEW QUESTION: 2 General Overview You are the Senior Database Administrator (DBA) for a software development company named Leaffield Solutions. The company develops software applications custom designed to meet customer requirements. Requirements Leaffield Solutions has been asked by a customer to develop a web-based Enterprise Resource Planning and Management application. The new application will eventually replace a desktop application that the customer is currently using. The current application will remain in use while the users are trained to use the new web-based application. You need to design the SQL Server and database infrastructure for the web-based application. Databases You plan to implement databases named Customers, Sales, Products, Current_Inventory, and TempReporting. The Sales database contains a table named OrderTotals and a table named SalesInfo. A stored procedure named SPUpdateSalesInfo reads data in the OrderTotals table and modifies data in the SalesInfo table. The stored procedure then reads data in the OrderTotals table a second time and makes further changes to the information in the SalesInfo table. The Current_Inventory database contains a large table named Inv_Current. The Inv_Current table has a clustered index for the primary key and a nonclustered index. The primary key column uses the identity property. The data in the Inv_Current table is over 120GB in size. The tables in the Current_Inventory database are accessed by multiple queries in the Sales database. Another table in the Current_Inventory database contains a self-join with an unlimited number of hierarchies. This table is modified by a stored procedure named SPUpdate2. An external application named ExternalApp1 will periodically query the Current_Inventory database to generate statistical information. The TempReporting database contains a single table named GenInfo. A stored procedure named SPUpdateGenInfo combines data from multiple databases and generates millions of rows of data in the GenInfo table. The GenInfo table is used for reports. When the information in GenInfo is generated, a reporting process reads data from the Inv_Current table and queries information in the GenInfo table based on that data. The GenInfo table is deleted after the reporting process completes. The Products database contains tables named ProductNames and ProductTypes. Current System The current desktop application uses data stored in a SQL Server 2005 database named DesABCopAppDB. This database will remain online and data from the Current_Inventory database will be copied to it as soon as data is changed in the Current_Inventory database. SQL

Servers A new SQL Server 2012 instance will be deployed to host the databases for the new system. The databases will be hosted on a Storage Area Network (SAN) that provides highly available storage. Design Requirements Your SQL Server infrastructure and database design must meet the following requirements: * Confidential information in the Current_Inventory database that is accessed by ExternalApp1 must be securely stored. * Direct access to database tables by developers or applications must be denied. * The account used to generate reports must have restrictions on the hours when it is allowed to make a connection. * Deadlocks must be analyzed with the use of Deadlock Graphs. * In the event of a SQL Server failure, the databases must remain available. * Software licensing and database storage costs must be minimized. * Development effort must be minimized. * The Tempdb databases must be monitored for insufficient free space. * Failed authentication requests must be logged. * Every time a new row is added to the ProductTypes table in the Products database, a user defined function that validates the row must be called before the row is added to the table. * When SPUpdateSalesInfo queries data in the OrderTotals table the first time, the same rows must be returned along with any newly added rows when SPUpdateSalesInfo queries data in the OrderTotals table the second time. You need to plan the SQL Server 2012 deployment that meets the design requirements. Which of the following steps should you perform? **A.** Configure Failover Clustering **B.** Upgrade the existing SQL Server 2005 server to SQL Server 2012. **C.** Install two new servers running SQL Server 2012 **D.** Configure AlwaysOn **E.** Install one new server running SQL Server 2012. **Answer: B,D,E**

NEW QUESTION: 3 A customer service department has a business need to send high volumes of confidential information to customers electronically. All emails go through a DLP scanner. Which of the following is the BEST solution to meet the business needs and protect confidential information? **A.** Automatically encrypt impacted incoming emails **B.** Automatically encrypt impacted outgoing emails **C.** Monitor impacted outgoing emails **D.** Prevent impacted outgoing emails **Answer: B** Explanation: Encryption is done to protect confidentiality and integrity of data. It also provides authentication, nonrepudiation and access control to the data. Since all emails go through a DLP scanner and it is outgoing mail that requires protection then the best option is to put a system in place that will encrypt the outgoing emails automatically. Incorrect Answers: B. Incoming email is not the issue at hand. The outgoing email is the confidential information being sent that requires protection. C. Monitoring outgoing mail is already being done by the DLP system in place. D. You cannot prevent these emails from being sent out as it is part of the business procedure. NEW QUESTION: 4 **A.** Option A **B.** Option C **C.** Option B **D.** Option D **Answer: A** Explanation: there are three profiles for Windows Firewall with Advanced Security: Profile Description Domain Applied to a network adapter when it is connected to a network on which it can detect a domain controller of the domain to which the computer is joined. Private Applied to a network adapter when it is connected to a network that is identified by the user or administrator as a private network. A private network is one that is not connected directly to the Internet, but is behind some kind of security device, such as a network address translation (NAT) router or hardware firewall. For example, this could be a home network, or a business network that does not include a domain controller. The Private profile settings should be more restrictive than the Domain profile settings. Public Applied to a network adapter when it is connected to a public network such as those available in airports and coffee shops. When the profile is not set to Domain or Private, the default profile is Public. The Public profile settings should be the most restrictive because the computer is connected to a public network where the security cannot be controlled. For example, a program that accepts inbound connections from the Internet (like a file sharing program) may not work in the Public profile because the Windows Firewall default setting will block all inbound connections to programs that are not on the list of allowed programs. Each network adapter is assigned the firewall profile that matches the

detected network type.
