NEW QUESTION: 1Taisei Fire and Marine Insurance Co**A.** relied almost entirely on Fortress Re's management team for information on the risks in its portfolio**B.** relied on the information it received from other members of the reinsurance pool to manage its risks**C.** had a full understanding from Fortress Re of the risks in the pool**D.** had a full understanding from other members of the pool of the pool's liabilities**Answer: A**

NEW QUESTION: 2You have an Azure subscription named Subscription1. Subscription1 contains the resources in the following table.In Azure, you create a private DNS zone named adatum.com. You set the registration virtual network to VNet2. The adatum.com zone is configured as shown in the following exhibit.For each of the following statements, select Yes if the statement is true. Otherwise, select No.NOTE: Each correct selection is worth one point.**Answer:** Explanation:ExplanationBox 1: NoAzure DNS provides automatic registration of virtual machines from a single virtual network that's linked to a private zone as a registration virtual network. VM5 does not belong to the registration virtual network though.Box 2: NoForward DNS resolution is supported across virtual networks that are linked to the private zone as resolution virtual networks. VM5 does belong to a resolution virtual network.Box 3: YesVM6 belongs to registration virtual network, and an A (Host) record exists for VM9 in the DNS zone. By default, registration virtual networks also act as resolution virtual networks, in the sense that DNS resolution against the zone works from any of the virtual machines within the registration virtual network.References:
<https://docs.microsoft.com/en-us/azure/dns/private-dns-overview>

NEW QUESTION: 3You need to construct the link to the summary report for the email that is sent to users.What should you do?**A.** Create a SharedAccessBlobPolicy and set the expiry time to two weeks from today.Call GetSharedAccessSignature on the container and use the resulting link.**B.** Create a SharedAccessAccountPolicy and call GetSharedAccessSignature on storage account and use the resulting link.**C.** Create a SharedAccessBlobPolicy and set the expiry time to two weeks from today.Call GetSharedAccessSignature on the blob and use the resulting link.**D.** Create a SharedAccessBlobPolicy and add it to the containers SharedAccessPolicies.Call GetSharedAccessSignature on the blob and use the resulting link.**Answer: A**Explanation: Explanation/Reference:Explanation:Scenario: Processing is performed by an Azure Function that uses version 2 of the Azure Function runtime. Once processing is completed, results are stored in Azure Blob Storage and an Azure SQL database. Then, an email summary is sent to the user with a link to the processing report. The link to the report must remain valid if the email is forwarded to another user.Create a stored access policy to manage signatures on a container's resources, and then generate the shared access signature on the container, setting the constraints directly on the signature.Code example: Add a method that generates the shared access signature for the container and returns the signature URI.static string

```
GetContainerSasUri(CloudBlobContainer container){//Set the expiry time and permissions for
the container.//In this case no start time is specified, so the shared access signature becomes
valid immediately.SharedAccessBlobPolicy sasConstraints = new SharedAccessBlobPolicy();
sasConstraints.SharedAccessExpiryTime = DateTimeOffset.UtcNow.AddHours(24);
sasConstraints.Permissions = SharedAccessBlobPermissions.List |
SharedAccessBlobPermissions.Write;//Generate the shared access signature on the container,
setting the constraints directly on the signature.string sasContainerToken =
container.GetSharedAccessSignature(sasConstraints);//Return the URI string for the container,
including the SAS token.return container.Uri + sasContainerToken;}Incorrect Answers:C: Call
GetSharedAccessSignature on the container, not on the blob.References:
https://docs.microsoft.com/en-us/azure/storage/blobs/storage-dotnet-shared-access-signatur
e-part-2
```

Testlet 1 Case Study This is a case study. Case studies are not timed separately. You can use as much exam time as you would like to complete each case. However, there may be additional case studies and sections on this exam. You must manage your time to ensure that you are able to complete all questions included on this exam in the time provided. To answer the questions included in a case study, you will need to reference information that is provided in the case study. Case studies might contain exhibits and other resources that provide more information about the scenario that is described in the case study. Each question is independent of the other question on this case study. At the end of this case study, a review screen will appear. This screen allows you to review your answers and to make changes before you move to the next sections of the exam. After you begin a new section, you cannot return to this section. To start the case study To display the first question on this case study, click the Next button. Use the buttons in the left pane to explore the content of the case study before you answer the questions. Clicking these buttons displays information such as business requirements, existing environment, and problem statements. If the case study has an All Information tab, note that the information displayed is identical to the information displayed on the subsequent tabs. When you are ready to answer a question, click the Question button to return to the question.

LabelMaker app Coho Winery produces bottles, and distributes a variety of wines globally. You are developer implementing highly scalable and resilient applications to support online order processing by using Azure solutions. Coho Winery has a LabelMaker application that prints labels for wine bottles. The application sends data to several printers. The application consists of five modules that run independently on virtual machines (VMs). Coho Winery plans to move the application to Azure and continue to support label creation. External partners send data to the LabelMaker application to include artwork and text for custom label designs.

Data You identify the following requirements for data management and manipulation:

- Order data is stored as nonrelational JSON and must be queried using Structured Query Language (SQL).
- Changes to the Order data must reflect immediately across all partitions.
- All reads to the Order data must fetch the most recent writes.

You have the following security requirements:

- Users of Coho Winery applications must be able to provide access to documents, resources, and applications to external partners.
- External partners must use their own credentials and authenticate with their organization's identity management solution.
- External partner logins must be audited monthly for application use by a user account administrator to maintain company compliance.
- Storage of e-commerce application settings must be maintained in Azure Key Vault.
- E-commerce application sign-ins must be secured by using Azure App Service authentication and Azure Active Directory (AAD).
- Conditional access policies must be applied at the application level to protect company content.

The LabelMaker applications must be secured by using an AAD account that has full access to all namespaces of the Azure Kubernetes Service (AKS) cluster.

LabelMaker app Azure Monitor Container Health must be used to monitor the performance of workloads that are deployed to Kubernetes environments and hosted on Azure Kubernetes Service (AKS). You must use Azure Container Registry to publish images that support the AKS deployment. Calls to the Printer API App fail periodically due to printer communication timeouts. Printer communications timeouts occur after 10 seconds. The label printer must only receive up to 5 attempts within one minute. The order workflow fails to

run upon initial deployment to Azure.Order.json
