Der Pfad, den Steinschlange wählte, wäre für Pferde nicht **AIF-C01 Testking** begehbar

gewesen, Sie zog sich aus und spülte den unangenehmen Schweißgeruch mit einer heißen Dusche fort.

Wachs el-Fellath verließ also die Stadt, ohne zu wissen, wohin er sich wenden AIF-C01 Schulungsunterlagen sollte, Obwohl ich na ja, nicht die Richtige für ihn bin, Lady Margaery ist meinem Sohn eine treue und gütige Gattin, seine Spielgefährtin und Gemahlin.

Und die Gewürzhändler und die Turmalinbruderschaft, **AIF-C01 Testking** Weder noch gestand ich, Seine Stimme klang erstickt.

**NEW QUESTION: 1A. Option BB. Option DC. Option FD. Option CE. Option EF. Option A**  
**Answer: D**Explanation: In this question, we only care about the Access Layer switches (Switch 3 & 4). Switch 3 has a lower bridge ID than Switch 4 (because the MAC of Switch 3 is smaller than that of Switch 4) so both ports of Switch 3 will be in forwarding state. The alternative port will surely belong to Switch 4. Switch 4 will need to block one of its ports to avoid a bridging loop between the two switches. But how does Switch 4 select its blocked port? Well, the answer is based on the BPDUs it receives from Switch 3. A BPDU is superior than another if it has: 1. A lower Root Bridge ID 2. A lower path cost to the Root 3. A lower Sending Bridge ID 4. A lower Sending Port ID These four parameters are examined in order. In this specific case, all the BPDUs sent by Switch 3 have the same Root Bridge ID, the same path cost to the Root and the same Sending Bridge ID. The only parameter left to select the best one is the Sending Port ID (Port ID = port priority + port index). In this case the port priorities are equal because they use the default value, so Switch 4 will compare port index values, which are unique to each port on the switch, and because Fa0/12 is inferior to Fa0/1, Switch 4 will select the port connected with Fa0/1 (of Switch 3) as its root port and block the other port -> Port fa0/11 of Switch 4 will be blocked (discarding role)

**NEW QUESTION: 2** Mary Carr is 62 years old, in good health, and will retire in four years from her position as the CEO and chairman of the board of a large professional services firm, Appleton Professional Services, which is located in the midwestern United States. Carr has approached Tim Houlis, her financial planner, for help in preparing an investment policy statement and accompanying asset allocation. Jack Timmons is Houlis' assistant. In a lunch meeting with Houlis and Timmons, Carr reveals that she is thinking of moving this year to be closer to Appleton's largest client. She is concerned about developing an investment plan now given that she will no longer have contact with Houlis if she does move. Houlis reassures her that this is not a problem. He states that a properly constructed investment policy statement can be readily implemented by her new financial advisor. Timmons states that the investment policy statement is a long-term document that should be changed only if the outlook for equities versus bonds and other assets changes. Carr's parents were successful business people who owned a series of small firms. Their success, however, did not come without challenges. Twice they had to liquidate businesses in which they were the primary shareholders. As a child, Carr became accustomed to the uncertainties of the entrepreneurial world. When she graduated from college, her parents provided her with the funds to purchase Appleton Professional Services. Appleton was a small firm at that point, but Carr has grown it into one of the larger firms in its industry, even though the professional services industry is cyclical and is susceptible to economic recessions. Appleton went public eight years ago and Carr retained a majority shareholder position when it did. Over time she has sold some of the stock but still has a controlling position in the firm. Despite the business difficulties Carr's parents experienced, they were able to amass a sizeable fortune in their later years. Including her inheritance and holdings in Appleton stock, Carr has a portfolio with a current value of \$6,000,000, most of which is invested in Appleton and other domestic and international equities. Carr has instructed Houlis and Timmons to grow her portfolio over time, focusing on capital appreciation and achieving long-term return goals. She would like to leave her children a

sizeable inheritance. Carr is single with two children. Her oldest child, Mark, is 25 years old and financially independent. Her youngest son, John, is a junior in college at a prestigious liberal arts college in New England. The tuition payment for his last year of college of approximately \$40,000 is due at the end of this year. She has no mortgage on her house. Carr is an avid bird watcher and gifts \$50,000 a year to a local environmental group. She is concerned with the destruction of bird habitat, so she does not want to invest in highly-polluting industries or firms that are involved in real estate development. When she retires, Carr will receive a lump-sum, after-tax distribution of approximately \$500,000 from her firm. She will also begin collecting an annual pension payment equal to her current salary. The pension payment is indexed to inflation. She will be covered under Appleton's health insurance plan in retirement. Carr spends \$170,000 a year on vacations and living expenses, which is about equal to her current salary at Appleton. Houli estimates that Carr is taxed at an effective marginal rate of 30% on capital gains and income. Houli estimates an inflation rate of 3% for the rest of Carr's life expectancy, which he projects at 20 years or more, given her good health. With regard to generating adequate liquidity for Carr's portfolio, Timmons states that she need not invest entirely in income-generating assets. Instead, Carr can generate income from stock dividends, bond coupons, and the sale of assets. By being willing to generate income through the sale of assets, Carr would be able to broaden the types of securities available to her for investment. Timmons states that the problem with most assets that produce income (e.g., dividend paying stocks) is that their expected return is usually lower. He states that the advantage of his approach is that Carr could pursue higher return assets, such as small company stocks. Carr's time horizon can be best characterized as: **A.** short-term and single-stage. **B.** long-term and multistage. **C.** short-term and multistage. **Answer: B** Explanation: Carr has a long-term time horizon because she is in good health and has a life expectancy of 20 years or more. Her time horizon is multistage: the next four years of the pre-retirement phase and her remaining life thereafter, the retirement phase. (Study Session 18, LOS 68.c,f)

**NEW QUESTION: 3** Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question, you will NOT be able to return to it. As a result, these questions will not appear in the review screen. You have Azure IoT Edge devices that generate streaming data. On the devices, you need to detect anomalies in the data by using Azure Machine Learning models. Once an anomaly is detected, the devices must add information about the anomaly to the Azure IoT Hub stream. Solution: You deploy Azure Functions as an IoT Edge module. Does this meet the goal? **A.** No **B.** Yes **Answer: A** Explanation: Instead use Azure Stream Analytics and REST API. Note. Available in both the cloud and Azure IoT Edge, Azure Stream Analytics offers built-in machine learning based anomaly detection capabilities that can be used to monitor the two most commonly occurring anomalies: temporary and persistent. Stream Analytics supports user-defined functions, via REST API, that call out to Azure Machine Learning endpoints. **NEW QUESTION: 4** Which statement is true regarding the configuration of vSphere Standard Switches on ESXi5.5 hosts? **A.** Additional ports must be manually added to a vSwitch when the configured number of ports has been exhausted. The host does not require a reboot when this configuration change is made. **B.** Additional ports are automatically added to a vSwitch when the configured number of ports has been exhausted. The host does not require a reboot when this configuration change is made. **C.** Additional ports are automatically added to a vSwitch as needed, and a set number of ports is not configured. The host does not require a reboot when this configuration change is made. **D.** Additional ports must be manually added to a vSwitch

when the configured number of ports has been exhausted. The host requires a reboot when this configuration change is made.**Answer: C**
